

# DENTAL IMPLANTS

**Single Tooth Implant**– Single tooth implants are used to replace one tooth in any area of the mouth. Implants provide a strong stable tooth without anchoring or damaging adjacent teeth. They also cannot break or decay since they are made of titanium.

**Implant Bridge**– A implant bridge is used to replace multiple teeth. With two implants we can replace anywhere from 3 to 5 teeth. If you exceed 5 teeth then we would need to place more implants. This option can be used to replace all the teeth in either the upper or lower jaw with 4-6 Implants.

**Implant-Support Dentures**– This is where dentures are fixated to implants to replace all the teeth in the upper and/or the lower jaw. This makes the denture fit tight and snug so that there is no movement while eating and talking.
